## 5 ABSTRACT OF THE DISCLOSURE

6 A launch tube assembly including an aft launch tube portion, a forward launch tube portion, and a transfer sleeve having a 7 first end fixed to and adjacent the forward end of said aft 8 launch tube portion and a second end adjustably receiving the 9 10 forward launch tube portion. A forward end of the aft launch tube portion faces a rearward end of the forward launch tube 11 portion within the transfer sleeve. An adjustable plenum is 12 present having a volume within the transfer sleeve defined by an 13 adjusted distance between the facing ends of aft and forward 14 15 launch tube portions. An end cap is pinned to a forward end of 16 the forward launch tube portion, a gas generator housed in the 17 aft launch tube portion, and a countermeasure device is housed in the forward launch tube portion. An adjustably selected volume 18 of the plenum is such that a gas generated by the gas generator 19

will enable propulsion of the countermeasure device at a

predetermined acceleration from the forward launch tube portion.
